

# Understanding Load Control Receiver Lights

## Left Red Light

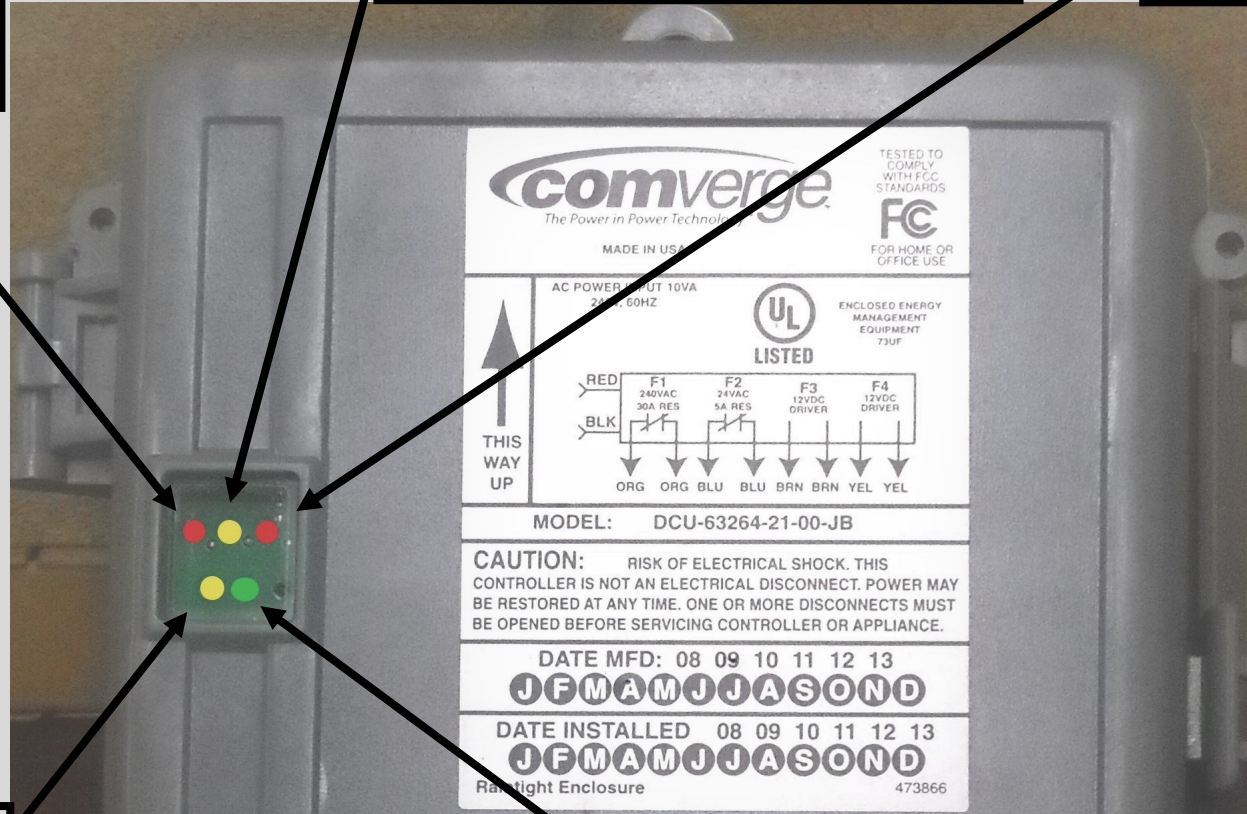

Illuminates when your water heater, irrigator, or interruptible commercial generator is under control.

## Upper-middle Yellow Light

Light is for electric heating or cycled air conditioning. When light is on, the electric heat is off or the A/C is being cycled.

## Right Red Light

This is not used by BCREA.

## Lower Yellow Light

This light is for additional electric heat. When the yellow light is on, the additional electric heat is off.

## Green Light

The green light indicates the receiver has power. If light is flashing the receiver is "talking" to the radio tower.
